Andrena algida Smith, 1853

Common Name:

| ELCODE: IIHYM351T0 | Taxonomic Serial No.: 654138 |

Synonyms: Andrena fuscisignata Viereck, 1917; Andrena brachycarpae Viereck and Cockerell, 1914; Andrena fernaldiella Viereck and Cockerell, 1914; Andrena fragiliformis Cockerell, 1906; Andrena albisigna Viereck, 1922

Taxonomy Notes:

Report last updated - May 1, 2019

Conservation Status

G5 S1

Occurrences, Range

Number of Occurrences: 2 occurrences. Nine voucher records (University of Alaska Museum Insect Collection)

AK Range Extent: N/A, insufficient data

Occupancy 4 km² grid cells: 2 grids are occupied

Nowacki Ecoregions:

Intermontane Boreal

North American Distribution:

Occurs throughout Canada, the western United States, and along the U.S./Canada border from North Dakota east to Maine.
Trends

Short-term: N/A, insufficient data

Long-term: N/A, insufficient data

Threats

Scope and Severity: Fairbanks population is within the city limits and subjected to general anthropogenic disturbance. The Fairbanks population would be subjected to fire suppression, the Eagle population might be subjected to fire suppression. Fire suppression encourages forest encroachment, contracting the steppe bluff habitat of both populations.

Ecology

Habitat: Appears to be restricted to steppe bluff habitat in Alaska. In Fairbanks found in steppe and disturbed roadside habitat.

Host Plants: Salix species, Taraxacum officinale, Pulsatilla patens (nectar and pollen), Rubus arcticus.
