**Relative maximum score**

46**
A. CLIMATIC COMPARISON

1.1. Has this species ever been collected or documented in Alaska?
- Yes - continue to 1.2
- No - continue to 2.1

1.2. From which eco-geographic region has it been collected or documented (see inset map)?
Proceed to Section B. INVASIVENESS RANKING
- Pacific Maritime
- Interior-Boreal
- Arctic-Alpine

Documentation: Sonchus oleraceus has been collected the Pacific Maritime and Interior-Boreal ecogeographic regions in Alaska (Hultén 1968, AKEPIC 2010).

2.1. Is there a 40 percent or higher similarity (based on CLIMEX climate matching, see references) between climates where this species currently occurs and:
- a. Juneau (Pacific Maritime region)?
  - Yes – record locations and percent similarity; proceed to Section B.
  - No
- b. Fairbanks (Interior-Boreal region)?
  - Yes – record locations and percent similarity; proceed to Section B.
  - No
- c. Nome (Arctic-Alpine region)?
  - Yes – record locations and percent similarity; proceed to Section B.
  - No

If “No” is answered for all regions; reject species from consideration

Documentation: In Scandinavia, Sonchus oleraceus is rarely found as far north as Nordland province in Norway and is concentrated in southern Norway, Sweden, and Finland (Lid & Lid 1998). It has been documented from a site 5 km northwest of Lillehammer, Norway, and from several locations near Lærdalsøyri, Norway, which have 49% and 45% climatic similarities with Nome, respectively (CLIMEX 1999, Vascular Plant Herbarium Oslo 2010). This species is also known to occur in several locations in Finland that have 40% or greater climatic similarities with Nome (CLIMEX 1999, NatureGate 2010).

B. INVASIVENESS RANKING

1. Ecological Impact
   1.1. Impact on Natural Ecosystem Processes
   a. No perceivable impact on ecosystem processes 0
   b. Has the potential to influence ecosystem processes to a minor degree (e.g., has a perceivable but mild influence on soil nutrient availability) 3
   c. Has the potential to cause significant alteration of ecosystem processes (e.g., increases sedimentation rates along streams or coastlines, degrades habitat important to waterfowl) 7
d. Has the potential to cause major, possibly irreversible, alteration or disruption of ecosystem processes (e.g., the species alters geomorphology, hydrology, or affects fire frequency thereby altering community composition; species fixes substantial levels of nitrogen in the soil making soil unlikely to support certain native plants or more likely to favor non-native species)
e. Unknown

Score U

Documentation: Sonchus oleraceus is a colonizer of disturbed areas, roadsides, waste areas, and cultivated areas (Lewin 1948, Fenner 1978, Hutchinson et al. 1984). In Alaska, it has only been observed growing in disturbed areas (AKEPIC 2010). While it may delay natural successional processes or impede the establishment of native species in disturbed areas, it is unlikely to significantly alter any ecosystem processes.

1.2. Impact on Natural Community Structure
a. No perceived impact; establishes in an existing layer without influencing its structure 0
b. Has the potential to influence structure in one layer (e.g., changes the density of one layer) 3
c. Has the potential to cause significant impact in at least one layer (e.g., creation of a new layer or elimination of an existing layer) 7
d. Likely to cause major alteration of structure (e.g., covers canopy, eliminating most or all lower layers) 10
e. Unknown

Score U

Documentation: Sonchus oleraceus is a colonizer of disturbed sites and may increase the density of vegetation in disturbed areas (Hutchinson et al. 1984).

1.3. Impact on Natural Community Composition
a. No perceived impact; causes no apparent change in native populations 0
b. Has the potential to influence community composition (e.g., reduces the population size of one or more native species in the community) 3
c. Has the potential to significantly alter community composition (e.g., significantly reduces the population size of one or more native species in the community) 7
d. Likely to cause major alteration in community composition (e.g., results in the extirpation of one or more native species, thereby reducing local biodiversity and/or shifting the community composition towards exotic species) 10
e. Unknown

Score U

Documentation: Sonchus oleraceus may decrease the number of native plants establishing in disturbed areas because of its rapid maturation and production of many, far-dispersing seeds. In undisturbed areas, it is believed to have no impact (Hutchinson et al. 1984).

1.4. Impact on associated trophic levels (cumulative impact of this species on the animals, fungi, microbes, and other organisms in the community it invades)

a. Negligible perceived impact 0
b. Has the potential to cause minor alteration (e.g., causes a minor reduction in nesting or foraging sites)  3

c. Has the potential to cause moderate alteration (e.g., causes a moderate reduction in habitat connectivity, interferes with native pollinators, or introduces injurious components such as spines, toxins)  7

d. Likely to cause severe alteration of associated trophic populations (e.g., extirpation or endangerment of an existing native species or population, or significant reduction in nesting or foraging sites)  10

e. Unknown  U

Score 5

Documentation: *Sonchus oleraceus* is a host for several nematode and aphid species and supports several major plant viruses (Hutchinson et al. 1984). The plant is edible and may be grazed upon by herbivores (Lewin 1948). Because *Sonchus oleraceus* is insect pollinated, its presence could alter plant-pollinator interactions. This species has weakly prickly leaves (DiTomaso and Healy 2007).

### 2. Biological Characteristics and Dispersal Ability

#### 2.1. Mode of reproduction

a. Not aggressive (produces few seeds per plant [0-10/m²] and not able to reproduce vegetatively)  0

b. Somewhat aggressive (reproduces by seed only [11-1,000/m²])  1

c. Moderately aggressive (reproduces vegetatively and/or by a moderate amount of seed [<1,000/m²])  2

d. Highly aggressive (extensive vegetative spread and/or many seeded [>1,000/m²])  3

e. Unknown  U

Score 3

Documentation: *Sonchus oleraceus* reproduces by seed only (DiTomaso and Healy 2007). Each plant produces between 5,200 and 6,800 seeds on average (Lewin 1948, Hutchinson et al. 1984).

#### 2.2. Innate potential for long-distance dispersal (wind-, water- or animal-dispersal)

a. Does not occur (no long-distance dispersal mechanisms)  0

b. Infrequent or inefficient long-distance dispersal (occurs occasionally despite lack of adaptations)  2

c. Numerous opportunities for long-distance dispersal (species has adaptations such as pappus, hooked fruit coats, etc.)  3

d. Unknown  U

Score 3

Documentation: Each seed has a pappus. Seeds are primarily dispersed by wind but can also be carried by water or spread after being ingested by birds or small mammals (Hutchinson et al. 1984, DiTomaso and Healy 2007).
2.3. Potential to be spread by human activities (both directly and indirectly – possible mechanisms include: commercial sale of species, use as forage or for revegetation, dispersal along highways, transport on boats, common contaminant of landscape materials, etc.).

a. Does not occur 
   Score 0
b. Low (human dispersal is infrequent or inefficient) 
   Score 1
c. Moderate (human dispersal occurs regularly) 
   Score 2
d. High (there are numerous opportunities for dispersal to new areas) 
   Score 3
e. Unknown 
   Score U

Documentation: The pappus becomes sticky when wet. Seeds can be transported by animals on feathers and fur and by humans on clothing, shoes, vehicles, and machinery (Hutchinson et al. 1984, DiTomaso and Healy 2007). Annual sowthistle has been documented as a contaminant in some commercial grass seed (DiTomaso and Healy 2007). Some seeds remain viable after passing through the digestive systems of livestock animals (Lewin 1948).

2.4. Allelopathic

a. No 
   Score 0
b. Yes 
   Score 2
c. Unknown 
   Score U

Documentation: Sonchus asper is not allelopathic (Hutchinson et al. 1984, DiTomaso and Healy 2007).

2.5. Competitive ability

a. Poor competitor for limiting factors 
   Score 0
b. Moderately competitive for limiting factors 
   Score 1
c. Highly competitive for limiting factors and/or able to fix nitrogen 
   Score 3
d. Unknown 
   Score U

Documentation: Sonchus oleraceus shows little reduction when grown amongst short turf suggesting that it is able to compete with surrounding vegetation of same or lesser height (Fenner 1978).

2.6. Forms dense thickets, has a climbing or smothering growth habit, or is otherwise taller than the surrounding vegetation.

a. Does not grow densely or above surrounding vegetation 
   Score 0
b. Forms dense thickets 
   Score 1
c. Has a climbing or smothering growth habit, or is otherwise taller than the surrounding vegetation 
   Score 2
d. Unknown 
   Score U

Documentation: Sonchus oleraceus does not form thickets nor does it climb or smother surrounding vegetation (DiTomaso and Healy 2007, AKEPIC 2010).

2.7. Germination requirements
a. Requires sparsely vegetated soil and disturbance to germinate 0
b. Can germinate in vegetated areas, but in a narrow range of or in special conditions 2
c. Can germinate in existing vegetation in a wide range of conditions 3
d. Unknown U

Score 0

Documentation: Sonchus oleraceus only germinates in disturbed areas (Hutchinson et al. 1997), and infestations have only been observed in disturbed areas in Alaska (AKEPIC 2010).

2.8. Other species in the genus invasive in Alaska or elsewhere

a. No 0
b. Yes 3
c. Unknown U

Score 3

Documentation: Sonchus arvensis ssp. uliginosus is a ranked invasive species in Alaska with an invasiveness rank of 73. Sonchus arvensis and S. asper are both known to occur as invasive species in Alaska (AKEPIC 2010). Sonchus arvensis is recognized as a noxious weed in 14 U.S. states: AK, AZ, CA, CO, HI, IA, ID, IL, MI, MN, NV, SD, WA, and WY (USDA 2010).

2.9. Aquatic, wetland, or riparian species

a. Not invasive in wetland communities 0
b. Invasive in riparian communities 1
c. Invasive in wetland communities 3
d. Unknown U

Score 1

Documentation: Sonchus oleraceus has been documented growing in riparian communities in California (DiTomaso and Healy 2007).

3. Ecological Amplitude and Distribution

3.1. Is the species highly domesticated or a weed of agriculture?

a. Is not associated with agriculture 0
b. Is occasionally an agricultural pest 2
c. Has been grown deliberately, bred, or is known as a significant agricultural pest 4
d. Unknown U

Score 3

Documentation: Sonchus oleraceus is a common annual weed in agricultural fields in Canada (Hutchinson et al. 1984), Europe (Lewin 1948), and Australia (Widderick 2010). Historically it has been grown as a potherb in Europe and as a food source for edible snails (Lewin 1948).

3.2. Known level of ecological impact in natural areas

a. Not known to impact other natural areas 0
b. Known to impact other natural areas, but in habitats and climate zones dissimilar to those in Alaska  1

c. Known to cause low impact in natural areas in habitats and climate zones similar to those in Alaska  3

d. Known to cause moderate impact in natural areas in habitats and climate zones similar to those in Alaska  4

e. Known to cause high impact in natural areas in habitats and climate zones similar to those in Alaska  6

f. Unknown  

Score  U  0

Documentation: In Canada *Sonchus oleraceus* grows in coastal habitats if they are naturally or anthropogenically disturbed, and in California it grows in some riparian communities and coastal salt marshes. No ecological impacts have been documented (Lewin 1948, Hutchinson et al. 1984, DiTomaso and Healy 2007).

3.3. Role of anthropogenic and natural disturbance in establishment

a. Requires anthropogenic disturbance to establish  0

b. May occasionally establish in undisturbed areas, readily establishes in naturally disturbed areas  3

c. Can establish independently of natural or anthropogenic disturbances  5

e. Unknown  

Score  U  1

Documentation: In the U.S., Canada, and much of Europe, *Sonchus oleraceus* primarily grows in disturbed areas, roadsides, waste places, and cultivated fields (Lewin 1948, Hutchinson et al. 1984, DiTomaso and Healy 2007). It can also grow in riparian and coastal areas and areas that have been naturally disturbed by grazing, digging, or fire (Lewin 1948). *Sonchus oleraceus* has not been documented growing in undisturbed areas in Alaska (AKEPIC 2010).

3.4. Current global distribution

a. Occurs in one or two continents or regions (e.g., Mediterranean region)  0

b. Extends over three or more continents  3

c. Extends over three or more continents, including successful introductions in arctic or subarctic regions  5

e. Unknown  

Score  U  5

Documentation: *Sonchus oleraceus* is native to Europe and is widespread through North America and Australia (Hutchinson et al. 1984). It has been collected from subarctic Norway and from a single location in arctic Norway (Vascular Plant Herbarium Oslo 2010).

3.5. Extent of the species' U.S. range and/or occurrence of formal state or provincial listing

a. Occurs in 0-5 percent of the states  0

b. Occurs in 6-20 percent of the states  2

c. Occurs in 21-50 percent of the states and/or listed as a problem weed (e.g., “Noxious,” or “Invasive”) in one state or Canadian province  4

d. Occurs in more than 50 percent of the states and/or listed as a problem weed in two or more states or Canadian provinces  5
Sonchus oleraceus is present in all 50 U.S. states (USDA 2010). It is listed as a noxious weed in British Colombia, Manitoba, Quebec, and Saskatchewan. Sonchus species are listed as noxious weeds in Ontario (Invaders 2010).

4. Feasibility of Control

4.1. Seed banks

a. Seeds remain viable in the soil for less than three years 0  
b. Seeds remain viable in the soil for three to five years 2  
c. Seeds remain viable in the soil for five years or longer 3  
e. Unknown  U  

Score 3

Documentation: Seeds can remain viable for 10 years in soil and possibly longer (Lewin 1948).

4.2. Vegetative regeneration

a. No resprouting following removal of aboveground growth 0  
b. Resprouting from ground-level meristems 1  
c. Resprouting from extensive underground system 2  
d. Any plant part is a viable propagule 3  
e. Unknown  U  

Score 0

Documentation: Sonchus oleraceus cannot resprout once the aboveground portion of the plant has been removed (Lewin 1948).

4.3. Level of effort required

a. Management is not required (e.g., species does not persist in the absence of repeated anthropogenic disturbance) 0  
b. Management is relatively easy and inexpensive; requires a minor investment of human and financial resources 2  
c. Management requires a major short-term or moderate long-term investment of human and financial resources 3  
d. Management requires a major, long-term investment of human and financial resources 4  
e. Unknown  U  

Score 2

Documentation: Manually removing plants before they release seeds is an effective control measure for Sonchus oleraceus (DiTomaso and Healy 2007). Sonchus oleraceus is susceptible to a broad selection of herbicides, although some biotypes may be resistant to herbicides (Hutchinson et al. 1984, Fraga and Tasende 2003).
