2.1. Is there a 40% or higher similarity (based on CLIMEX climate matching) between climates any where the species currently occurs and

Yes – record locations and similarity; proceed to Section B.

a. Juneau (South Coastal Region)?

Yes

Invasiveness Ranking

No b. Fairbanks (Interior-Boreal)?

Yes

Yes

Yes – record locations and similarity; proceed to Section B. Invasiveness Ranking

c. Nome (Arctic-Alpine)?

No

Yes – record locations and similarity; proceed to Section B. Invasiveness Ranking

No

- If "No" is answered for all regions, reject species from
- consideration

Documentation: *Zostera japonica* is a native of subtropical to cool seacoasts ranging from Vietnam, East Asia, mainland Russia and the Sakhalin Islands (Miki 1933, Shin and Choi 1998). The CLIMEX matching program indicates the climatic similarity between Juneau, Alaska and Akita, Japan is 55%. The native range of this species includes Vladivostok and Nevel'sk, Russia which have a 60% and 57% climatic match with Anchorage, respectively. Aquatic species are generally less susceptible to variation in terrestrial climates. Dwarf eelgrass is therefore likely to establish in the South Coastal and the coastal portions of the Interior-Boreal regions of Alaska.

B. INVASIVENESS RANKING

1. ECOLOGICAL IMPACT

1.1. Impact on Natural Ecosystem Processes

А.	No perceivable impact on ecosystem processes	0
B.	Influences ecosystem processes to a minor degree (e.g., has a perceivable but mild	3
	influence on soil nutrient availability)	
C.	Significant alteration of ecosystem processes (e.g., increases sedimentation rates along	7
	streams or coastlines, reduces open water that are important to waterfowl)	
D.	Major, possibly irreversible, alteration or disruption of ecosystem processes (e.g., the	10
	species alters geomorphology; hydrology; or affects fire frequency, altering	

community composition; species fixes substantial levels of nitrogen in the soil making

soil unlikely to support certain native plants or more likely to favor non-native species) Unknown

U.

		Score	8	
	 Documentation: Identify ecosystem processes impacted: The colonization of sparsely vegetated or bare intertidal flats by dwarf eelgrass represents a drastic modification of habitat. Increased eelgrass coverage slows we flow which increases sedimentation and reduces mean sediment grain size. Event eelgrass patches may raise the elevation of mudflats and disrupt ocean currents (Harrison and Bigley 1982, Posey 1988). Significant changes in the ecology of intertidal sediments are predicted as the exotic eelgrass spreads to potential habit. North America (Harrison and Bigley 1982). Rational: Sources of information: Harrison, P.G. and R. Bigley. 1982. The recent introduction of the seagrass <i>Zostet japonica</i> Aschers. and Graebn. to the Pacific coast of North America.
