### Additional Notes

*Paracorophium sp.* is a tube-building amphipod endemic to warm and temperate waters in the Southern Hemisphere. In North America, it has been introduced to California. The taxonomic identity of this introduced population is unknown.
1. Distribution and Habitat

1.1 Survival requirements - Water temperature

**Choice:** Unknown/Data Deficient

**Score:**

**High uncertainty?**

**Ranking Rationale:**
Temperatures requirements for survival are unknown.

**Background Information:**
Paracorophium spp. occur in warm temperate to cold temperate environments (Fofonoff et al. 2003). Occurrence records are available for Paracorophium species in Eureka (NAS database) which has an average water temperature that ranges from 10 to 11.1 C (Trinidad CA; NOAA 2017).

**Sources:**
NEMESIS; Fofonoff et al. 2003   NAS database, USGS 2017   NOAA 2017

---

1.2 Survival requirements - Water salinity

**Choice:** A

**Score:** 3.75 of

**High uncertainty?**

**Ranking Rationale:**
Survival has been observed in a variety of salinities from 0 ppt to full salinity.

**Background Information:**
Tolerant of a wide range of salinities. Has been observed in water ranging from 0 ppt to full salinity (Boyd et al. 2002; Chapman et al. 2002; Stevens et al. 2002; Chapman et al. 2002; Stevens et al. 2002; Chapman 2007 as qtd. In Fofonoff et al. 2003; Southern California Association of Marine Invertebrate Taxonomists 2008).

**Sources:**

---

1.3 Establishment requirements - Water temperature

**Choice:** Unknown/Data Deficient

**Score:**

**Ranking Rationale:**
No information available in the literature.

**Sources:**
None listed

---

1.4 Establishment requirements - Water salinity

**Choice:** Unknown/Data Deficient

**Score:**

**Ranking Rationale:**
No information available in the literature.

**Sources:**
None listed
1.5 Local ecoregional distribution

**Choice:** Present in an ecoregion greater than two regions away from the Bering Sea

**Score:** 1.25 of 5

**Ranking Rationale:**
Present in an ecoregion three regions away from the Bering Sea.

**Background Information:**
Occurrences for Paracorophium spp. have been reported in Humboldt Bay, Tomales Bay, Morro Bay, and Elkhorn Slough CA (Boyd et al. 2002; Southern California Association of Marine Invertebrate Taxonomists 2008; Graening et al. 2012; California Department of Fish and Wildlife 2014).

**Sources:**

1.6 Global ecoregional distribution

**Choice:** In few ecoregions globally

**Score:** 1.75 of 5

**High uncertainty?**

**Ranking Rationale:**
Paracorophium spp. are present to numerous locations in the Southern Hemisphere, however, these results are for three species; the species located in California may be more limited in its distribution.

**Background Information:**
Paracorophium spp. is known from its introduced range: Humboldt Bay, Tomales Bay, Elkhorn Slough, and Morro Bay, CA (Chapman 2007 as qtd. In Fofonoff et al. 2003; Southern California Association of Marine Invertebrate Taxonomists 2008; Graening et al. 2012; California Department of Fish and Wildlife 2014). It is an unknown amphipod that may actually be one or more species. Other paracorophium species are mainly known in the Southern Hemisphere with specific species occurring in New Zealand, Australia, Chile, Palau, and Thailand (Gonzalez 1986, as qtd. in Fofonoff et al. 2003; Barnard and Karaman 1991; Fenwick 2001; Myers 2009; Wongkhamhaeng et al. 2015).

**Sources:**

1.7 Current distribution trends

**Choice:** Unknown/Data Deficient

**Score:**

**High uncertainty?**

**Ranking Rationale:**
Data deficient. The only non-native records for Paracorophium spp. are in California (2011; NAS, USGS 2017). No information available regarding recent spread in non-native range.

**Background Information:**
No information available in the literature.

**Sources:**
NAS database, USGS 2017

---

**Section Total - Scored Points:** 6.75
**Section Total - Possible Points:** 13.75
**Section Total - Data Deficient Points:** 16.25
2. Anthropogenic Transportation and Establishment

2.1 Transport requirements: relies on use of shipping lanes (hull fouling, ballast water), fisheries, recreation, mariculture, etc. for transport

<table>
<thead>
<tr>
<th>Choice</th>
<th>Has been observed using anthropogenic vectors for transport but has rarely or never been observed moving independent of anthropogenic vectors once introduced</th>
</tr>
</thead>
</table>

**Ranking Rationale:**
Reported as using ballast water and hull fouling as a transportation vector. Has not been observed moving naturally outside of areas of introduction.

**Background Information:**
Paracorophium spp. is considered native to New Zealand and South America. The lumber trade with New Zealand and Brazil could have introduced this species to California through hull fouling, dry ballast, and ballast water (Boyd et al. 2002; NAS database, USGS 2017). Ballast water and hull fouling are listed as potential transportation vectors for Paracorophium sp. in the NAS database (NAS database, USGS 2017).

**Sources:**
Boyd et al. 2002   NAS database, USGS 2017   NEMESIS; Fofonoff et al. 2003

---

2.2 Establishment requirements: relies on marine infrastructure, (e.g. harbors, ports) to establish

<table>
<thead>
<tr>
<th>Choice</th>
<th>Does not use anthropogenic disturbance/infrastructure to establish</th>
</tr>
</thead>
</table>

**Ranking Rationale:**
Establishes in natural habitat; has not been observed establishing on marine infrastructure.

**Background Information:**
Paracorophium spp. in CA is found in muddy intertidal areas and salt marshes. Does not require marine infrastructure to establish.

**Sources:**
NEMESIS; Fofonoff et al. 2003

---

2.3 Is this species currently or potentially farmed or otherwise intentionally cultivated?

<table>
<thead>
<tr>
<th>Choice</th>
<th>No</th>
</tr>
</thead>
</table>

**Ranking Rationale:**
This species is not currently farmed or intentionally cultivated.

**Sources:**
NEMESIS; Fofonoff et al. 2003

---

**Section Total - Scored Points:** 2
**Section Total - Possible Points:** 10
**Section Total - Data Deficient Points:** 0
### 3. Biological Characteristics

#### 3.1 Dietary specialization

**Choice:** A  Generalist at all life stages and/or foods are readily available in the study area

**Score:** 5 of 5

**Ranking Rationale:**
Preys on numerous taxa readily available in the Bering Sea.

**Background Information:**
If Paracorophium spp. are like other corophiid amphipods, it probably consumes phytoplankton, detritus, benthic microalgae, and filamentous epiphytic algae (Bousfield 1973).

**Sources:**
Bousfield 1973  NEMESIS; Fofonoff et al. 2003

#### 3.2 Habitat specialization and water tolerances

Does the species use a variety of habitats or tolerate a wide range of temperatures, salinity regimes, dissolved oxygen levels, calcium concentrations, hydrodynamics, pollution, etc?

**Choice:** B  Requires specialized habitat for some life stages (e.g., reproduction)

**Score:** 3.25 of 5

**Ranking Rationale:**
Near shore species, restricted to muddy intertidal habitats, salt marshes, and shallow channels, often with freshwater input. Tolerant of a variety of habitats (intertidal and freshwater), temperatures and salinity regimes.

**Sources:**
NEMESIS; Fofonoff et al. 2003

#### 3.3 Desiccation tolerance

**Choice:** U  Unknown

**Score:**

**Ranking Rationale:**
No information available in the literature.

**Sources:**
None listed

#### 3.4 Likelihood of success for reproductive strategy

i. Asexual or hermaphroditic  
ii. High fecundity (e.g. >10,000 eggs/kg)  
iii. Low parental investment and/or external fertilization  
iv. Short generation time

**Choice:** C  Low – Exhibits none of the above characteristics

**Score:** 1.75 of 5

**Ranking Rationale:**
Sexual reproduction, low fecundity, high parental investment, internal fertilization.

**Background Information:**
Paracorophium spp. are not asexual or hermaphroditic. Females brood small broods of eggs and sexual maturity is achieved at approximately 6 months of age.

**Sources:**
NEMESIS; Fofonoff et al. 2003
### 3.5 Likelihood of long-distance dispersal or movements

Consider dispersal by more than one method and/or numerous opportunities for long or short distance dispersal e.g. broadcast, float, swim, carried in currents; vs. sessile or sink.

<table>
<thead>
<tr>
<th>Choice</th>
<th>Unknown</th>
</tr>
</thead>
</table>

**Ranking Rationale:**

**Background Information:**

Dispersal is limited to crawling, swimming or rafting (Fofonoff 2003). Distances are not mentioned in the literature.

**Sources:**

NEMESIS; Fofonoff et al. 2003

### 3.6 Likelihood of dispersal or movement events during multiple life stages

i. Can disperse at more than one life stage and/or highly mobile 
ii. Larval viability window is long (days v. hours)  
iii. Different modes of dispersal are achieved at different life stages (e.g. unintentional spread of eggs, migration of adults)

<table>
<thead>
<tr>
<th>Choice</th>
<th>Low – Exhibits none of the above characteristics</th>
</tr>
</thead>
</table>

**Ranking Rationale:**

**Background Information:**

There is no larval stage for Paracorophium spp. and adults have low mobility with dispersal being limited to crawling, swimming and rafting (Fofonoff et al. 2003).

**Sources:**

NEMESIS; Fofonoff et al. 2003

### 3.7 Vulnerability to predators

<table>
<thead>
<tr>
<th>Choice</th>
<th>Multiple predators present in the Bering Sea or neighboring regions</th>
</tr>
</thead>
</table>

**Ranking Rationale:**

**Background Information:**

Numerous predators, many of which exist in the Bering Sea.

**Sources:**

NEMESIS; Fofonoff et al. 2003

---

Report updated on  Wednesday, December 06, 2017
4. Ecological and Socioeconomic Impacts

4.1 Impact on community composition

Choice:  No impact

High uncertainty? ✓

Ranking Rationale:  To date, no impacts on community composition have been reported for Paracorophium spp., and given its ecology, none would be expected.

Sources: None listed

Background Information:  No information available in the literature.

Sources: No impact

NEMESIS; Fofonoff et al. 2003

Score: 0 of 5

2.5

High uncertainty?

4.2 Impact on habitat for other species

Choice:  No impact

High uncertainty? ✓

Ranking Rationale:  To date, no impacts on habitat for other species have been reported for Paracorophium spp., and given its ecology, none would be expected.

Sources: NEMESIS; Fofonoff et al. 2003

Background Information:  No information available in the literature.

Score: 0 of 5

2.5

High uncertainty?

4.3 Impact on ecosystem function and processes

Choice:  No impact

High uncertainty? ✓

Ranking Rationale:  To date, no impacts on ecosystems functions and processes have been reported for Paracorophium spp., and given its ecology, none would be expected.

Sources: NEMESIS; Fofonoff et al. 2003

Background Information:  No information available in the literature.

Score: 0 of 5

2.5

High uncertainty?

4.4 Impact on high-value, rare, or sensitive species and/or communities

Choice:  No impact

High uncertainty? ✓

Ranking Rationale:  To date, no impacts on high-value, rare, or sensitive species have been reported for Paracorophium spp., and given its ecology, none would be expected.

Sources: NEMESIS; Fofonoff et al. 2003

Background Information:  No information available in the literature.

Score: 0 of 5

2.5

High uncertainty?
4.5 Introduction of diseases, parasites, or travelers

What level of impact could the species' associated diseases, parasites, or travelers have on other species in the assessment area? Is it a host and/or vector for recognized pests or pathogens, particularly other nonnative organisms?

**Choice:** Limited – Has limited potential to spread one or more organisms, with limited impact and/or within a very limited region

**Score:** 0.75

**Ranking Rationale:**
A closely related species was found to be a host to a nematode species.

**Background Information:**
Paracorophium excavatum, a closely related species found in New Zealand, was found to be a host for a previously undescribed fourth-stage larvae of anisakid nematodes. The impacts of this parasite are unknown and it has not been studied in introduced populations (Luque et al. 2007).

**Sources:**
Luque et al. 2007, NEMESIS; Fofonoff et al. 2003

---

4.6 Level of genetic impact on native species

Can this invasive species hybridize with native species?

**Choice:** Unknown

**Score:**

**Ranking Rationale:**
No information available in the literature.

**Sources:**
None listed

---

4.7 Infrastructure

**Choice:** No impact

**Score:**

**Ranking Rationale:**
Paracorophium spp. have not been observed interacting with marine infrastructure and no impacts on infrastructure are predicted.

**Sources:**
NEMESIS; Fofonoff et al. 2003

---

4.8 Commercial fisheries and aquaculture

**Choice:** No impact

**High uncertainty?**

**Ranking Rationale:**
To date, no impacts on commercial fisheries and aquaculture have been reported for Paracorophium spp., and given its ecology, none would be expected.

**Sources:**
None listed

**Background Information:**
No information available in the literature.
4.9  Subsistence

**Choice:** D  
No impact

**Ranking Rationale:**
To date, no impacts on subsistence have been reported for Paracorophium spp., and given its ecology, none would be expected.

**Background Information:**
No information available in the literature.

**Sources:**
None listed

---

4.101  Recreation

**Choice:** D  
No impact

**Ranking Rationale:**
To date, no impacts on recreation have been reported for Paracorophium spp., and given its ecology, none would be expected.

**Background Information:**
No information available in the literature.

**Sources:**
NEMESIS; Fofonoff et al. 2003

---

4.11  Human health and water quality

**Choice:** D  
No impact

**High uncertainty?**

**Ranking Rationale:**
To date, no impacts on human health or water quality have been reported for Paracorophium spp., and given its ecology, none would be expected.

**Background Information:**
No information available in the literature.

**Sources:**
NEMESIS; Fofonoff et al. 2003

---

**Section Total - Scored Points:** 0.75  
**Section Total - Possible Points:** 27.5  
**Section Total - Data Deficient Points:** 2.5
5. Feasibility of prevention, detection and control

5.1 History of management, containment, and eradication

**Choice:** C

**Attempted; control methods are currently in development/being studied**

**Ranking Rationale:**

No species-specific management, containment or eradication exists for Paracorophium spp. Management and control methods do exist for ballast water and hull fouling in general.

**Sources:**
Hagan et al. 2014   Ruiz and Reid 2007

**Background Information:**

Ballast water exchange is the method currently used by most ships to reduce the spread of species by ballast water. However, it is considered a short-term or “stop-gap” option until more effective, technology-based methods become available e.g., ballast water treatment systems (Ruiz and Reid 2007). The treatment of ballast water is an active area of research as vessels are forced to comply with new regulations. Hull fouling technologies that treat and/or safely dispose of marine organisms, without being toxic to the environment, are currently being studied.

5.2 Cost and methods of management, containment, and eradication

**Choice:** B

**Major short-term and/or moderate long-term investment**

**Ranking Rationale:**

To comply with ballast water regulations, vessels will have to equip themselves with an onboard ballast water treatment system. These systems represent a major short-term cost for vessel owners (up to $3 million), with additional costs over time to maintain and replace equipment (e.g. chemicals, filters, UV light bulbs). Current hull fouling technologies that address invasive species require purchasing of specialized equipment and regular cleaning.

**Sources:**
FUSP 2013   Zagdan 2010

**Background Information:**

No species specific methods have been reported in the literature. However, methods to deal with ballast water and hull fouling have been tested.

The costs associated with purchasing a ballast water treatment system depend on the volume of the water that needs to be treated. Systems with a pump capacity of 200-250 m3/h can cost form $175,000 to $490,000. The estimated price for larger systems with a pump capacity of around 2000 m3/h range from $650,000 to nearly $3 million.

Current hull fouling technologies that address invasive species require purchasing of specialized equipment and regular cleaning.
5.3 Regulatory barriers to prevent introductions and transport

**Ranking Rationale:**
Regulatory barriers and preventative measures for general biofouling and ballast water discharge apply to this species but nothing specific could be found in the literature. Compliance with general fouling regulations are voluntary.

**Background Information:**
In the U.S., Coast Guard regulations require masters and ship owners to clean vessels and related infrastructure on a “regular” basis (CFR 33 § 151.2050). Failure to remove fouling organisms is punishable with a fine (up to $27,500). However, because the word “regular” is not defined, regulations are hard to enforce and compliance remains largely voluntary (Hagan et al. 2014). Cleaning of recreational vessels is also voluntary, although state and federal programs are in place to encourage owners to clean their boats. Boat inspection is mandatory on some lakes (e.g. Lake Tahoe in CA/NV, Lake George in NY). In summer 2016, state and federal agencies conducted voluntary inspections for aquatic invasive species on trailered boats entering the state of Alaska (Davis 2016).

**Sources:**

5.4 Presence and frequency of monitoring programs

**Ranking Rationale:**
No monitoring programs currently exist for Paracorophium spp.

**Background Information:**
No monitoring programs currently exist for Paracorophium spp.

**Sources:**
None listed

5.5 Current efforts for outreach and education

**Ranking Rationale:**
Education and outreach efforts are limited to more general invasive awareness and prevention methods such as ballast water discharge reduction.

**Background Information:**
Education and outreach efforts are limited to more general invasive awareness and prevention methods such as ballast water discharge reduction.

**Sources:**
None listed
**Bering Sea Marine Invasive Species Assessment**
Alaska Center for Conservation Science
