Pacific Wren, Semidi
*Troglodytes pacificus semidiensis*

Note: This assessment refers to this subspecies only. A species level report, which refers to all associated subspecies, is also available.

**Review Status:** Peer-reviewed  
**Version Date:** 15 December 2017

### Conservation Status

**NatureServe:**  
G Rank: G5T2T3  
S Rank: S2S3

**Agency:**  
ADFG & G: Species of Greatest Conservation Need  
USFWS:  
BLM:

**IUCN:**

**Audubon AK:** Yellow

### Final Rank

Higher numerical scores denote greater concern

**Conservation category:** IV. Orange
unknown status and high biological vulnerability and action need

### Status

- **Population Trend in Alaska (-10 to 10)**  
  Unknown.  
  **Score:** 0

- **Distribution Trend in Alaska (-10 to 10)**  
  Unknown.  
  **Score:** 0

**Status Total:** 0

### Biological

- **Population Size in Alaska (-10 to 10)**  
  Unknown.  
  **Score:** 0

- **Range Size in Alaska (-10 to 10)**  
  Resides on the Semidi Islands (ADFG 2006a). Range is ~29 sq. km calculated from ACCS range map (ACCS 2017a).  
  **Score:** 10

- **Population Concentration in Alaska (-10 to 10)**  
  Does not concentrate, but only occurs on Semidi Islands.  
  **Score:** 2
Reproductive Potential in Alaska

Age of First Reproduction (-5 to 5)

Presumably during their second year (Toews and Irwin 2012).

Number of Young (-5 to 5)

Unknown for this subspecies, but probably 6-7 eggs per clutch (Heath 1920). On St. George Island, some females laid two clutches in one season (Heath 1920).

Ecological Specialization in Alaska

Dietary (-5 to 5)

Invertebrates, especially insects, spiders, and amphipods (Toews and Irwin 2012).

Habitat (-5 to 5)

Habitat requirements specific to the Semidi subspecies are unknown. In the Aleutians, found along the coast and on beaches (Gibson and Byrd 2007; Withrow 2015). Nests on sea cliffs and boulder fields in dense vegetation within grass meadows and tall forb meadows (Gibson and Byrd 2007). May also nest in the roots of upturned trees, in old stumps, brush piles or abandoned buildings (Kessler and Kogut 1985; Armstrong 2008).

Biological Total: 12

Action - variables measure current state of knowledge or extent of conservation efforts directed toward a given taxon. Higher action scores denote greater information needs due of lack of knowledge or conservation action. Action scores range from -40 (lower needs) to 40 (greater needs).

<tbody>
<tr>
<td>The factors that regulate the dynamics of this subspecies are unknown. They have not responded dramatically to the eradication of foxes, presumably because of continued predation from rats (ADFG 2006a). Even still, the abundance of Pacific Wren on Hawadax Island (subspecies kiskensis) did not increase significantly five years after rats were eradicated (Croll et al. 2016). Restricted distribution may put the subspecies at risk from factors such as inclement weather and low genetic diversity (Paine 1985; Pruett et al. 2017). Other Pacific Wren island populations are known to reach low numbers after severely cold and snowy winters (Heath 1920; Paine 1985; Toews and Irwin 2012).</td>
<td>10</td>
